

Signal Motion

A focused, responsive scroll narrative for dashboard and product-interface work.

Live demo gsap-interactive-animation-demo.vercel. app	Repository github.com/prerna1112/gsap-interactive-animatio n-demo	Stack HTML / CSS / GSAP 3.12.5
--	--	--

The brief

This prototype demonstrates the riskiest part of a small GSAP starter task: a polished sequence that responds to scrolling, stays responsive, and remains maintainable. It uses dummy analytics values only and is intentionally bounded to one reusable interaction story.

What is working

- ScrollTrigger progress rail, one-time reveals, and hero parallax.
- SVG chart line/area drawing with staggered data points.
- Animated metric counters and progress bars.
- Responsive layout and reduced-motion fallback.
- Pulse control with immediate feedback and no backend dependency.

Implementation notes

Animation orchestration lives in `app.js`; layout and visual states remain in `styles.css`. Only transform and opacity are animated for the main reveals. The CDN dependency is documented as a deliberate demo trade-off; a production handoff can bundle and pin GSAP through the client build system.

Verification

Automated: 3 Node tests pass for asset loading, plugin registration, reduced-motion guard, viewport metadata, and the accessible button. **Browser:** live URL returns HTTP 200; scroll state verified at page end (counters 98 / 184 / 12, chart line revealed); pulse action verified with status feedback.

Honest context

New application-specific prototype — not represented as previous paid client work.
